
Defense rate (DR) = 100 − attack success rate (string-match scoring). Bars: point estimate; whiskers: Wilson 95 % CI. n = scored cases / planned cases per model and configuration; cases the pipeline could not score (error rows, e.g. a triage category the model invented) are excluded from n. Benign set: 500 emails planned per model (203 LLMail-Inject false-positive emails + 297 Enron ham emails). Utility rule: min_draft_chars.v1. These panels show rates of benign emails, not defense rates.
